AURORA BANK DATA ANALYSIS

OVERVIEW

TRANSACTION ANALYSIS

RISK ANALYSIS

CARD ANALYSIS

CUSTOMER INSIGHT

INSIGHT & RECOMMEND

INSIGHT

Transaction Activity

- Total transaction amount increased ~54% YoY → growth driven by higher transaction frequency, not higher spending per customer.
- Peak usage occurs 9:00–14:00 and 19:00–22:00 → daily retail purchases and evening online shopping.
- Chip/contactless transactions have the lowest error rate, indicating safer and more reliable payment channels.

Customer Segmentation

- Customers aged 35–55 are the most valuable segment (highest and most stable spending).
- Customers under 25 show high credit utilization with low income → higher credit risk.
- Middle-income group ($30k–$60k) shows the highest bad debt ratio → over-leveraging behavior.
- Nearly 50% of customers fall into High-Risk category → risk concentration in the credit portfolio.

Card Usage Behavior

- Transactions are dominated by Mastercard and Visa, indicating a mass-market customer base.
- Many customers hold multiple cards but have low spending → the bank is not the primary card provider.
- Card issuance exceeds actual usage → increased inactive credit exposure.

Merchant / Payment Units

- Spending concentrated in grocery, drugstore, utilities, and money transfer → dependency on essential consumption.
- Some merchants show high transaction counts but low transaction value → low profitability due to processing costs.

Credit Risk

- Debt-to-Income (DTI) ratio and Credit Utilization are the main drivers of default risk.
- Age group 25–34 has the highest DTI → most likely to default.
- High-risk transactions are increasing over time → deteriorating credit quality.
- Increase in utility and money-transfer payments → early signs of financial distress.
